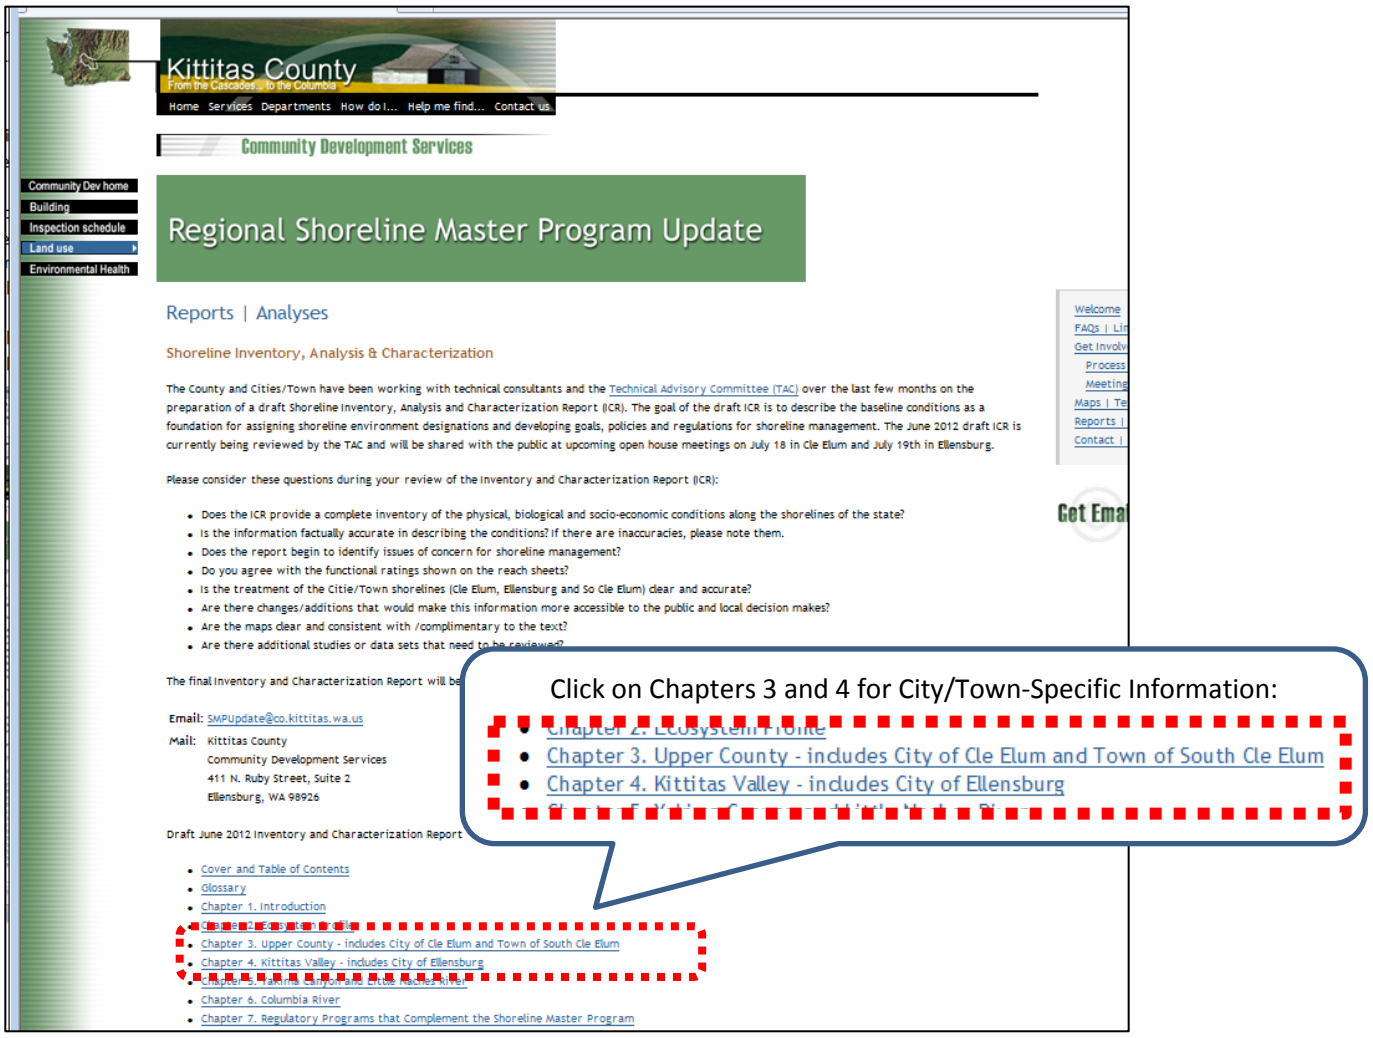
Kittitas County Regional SMP Update
Shoreline Inventory and Characterization Report Discussion Handout
July 18th and 19th 2012 Community Visioning Open Houses

The goal of the draft Shoreline Inventory and Characterization Report ICR is to describe the baseline conditions of the County's shorelines, and then to use the baseline conditions to assign environment designations. The draft ICR also will help the regional shoreline planning team to and develop goals, policies and regulations for shoreline management. The draft ICR is still a work in progress, so all comments are welcome. It may be helpful to consider these questions while you review this document:

- Does the ICR provide a complete inventory of the physical, biological and socio-economic conditions along the shorelines of the state?
- Is the information factually accurate in describing the conditions?
- Does the report begin to identify issues of concern for shoreline management?
- Do you agree with the functional ratings shown on the reach sheets?
- Is the treatment of the City shorelines (Cle Elum, Ellensburg and South Cle Elum) clear and accurate?
- Are there changes/additions that would make this information more accessible to the public and local decision makers?
- Are the maps clear and consistent with/complimentary to the text?
- Are there additional studies or data sets that need to be reviewed?

As you gather your comments, please fill out the comment matrix on the next page.

The June 2012 Draft Shoreline ICR is online at: http://www.co.kittitas.wa.us/cds/smp/reports.asp



Please use this matrix to compile your comments on the Draft Inventory and Characterization Report. (You can complete this matrix electronically and return it via email by clicking on the "Submit Form" button and following the instructions).
